INITIAL ACCESS

Inconclusive — image unprofileable. Volatility3 2.28.0 could not validate a Windows kernel symbol table for this 1 GiB RAM capture, so pslist/netscan/malfind/svcscan returned placeholder/empty output. **No clean-vs-compromised determination is possible.** One medium finding (F-CONTACTME-001) was approved to document the unprofileable outcome through the full evidence → finding → approval → sealed-report loop.

TOP FINDINGS

MEDIUM

F-CONTACTME-001 — Memory image unprofileable

Volatility3 2.28.0 could not validate a Windows kernel symbol table; pslist=11 placeholder rows (pid:0/unknown), netscan=0, malfind=0, svcscan=0, cmdline=requirements error. Degraded/gated results — not confirmed-clean. likelihood unlikely · confidence high (LCA) · risk score 6 · provenance MCP.

INFO

No IOCs / no timeline

Sealed report iocs.count=0, timeline.count=0. Nothing to catalogue from an unprofileable capture; absence reflects tool-gating, not a clean system.

HEADLINE RECOMMENDATION

P1

Re-acquire or re-profile the image with a matching Volatility3 symbol table (confirm the source host's OS/build), then re-run the windows.* plugins. Hold the case INCONCLUSIVE — do not read the 0-count results as a clean bill of health. A populated process list, not an HTTP-200, is the signal a profile matched.
