

Executive Summary — SRL-2018

Key Performance Indicators

Metric	Value
Approved findings	9
Critical	3
High	3
Affected hosts	6
Unique ATT&CK techniques	10
Dwell time (days)	143.0

Top tactics: Persistence, Lateral Movement, Credential Access, Command & Control, Defense Evasion

Critical & High Findings

- [Domain controller fully compromised — bi-daily service persistence + terminal C2 \(.base-dc\)](#) (critical) — Catastrophic: control of the DC is control of every domain identity; trust in all credentials is void until a krbtgt double-reset completes. (see analyst finding [F-01](#))
- [Pass-the-hash domain traversal across the DMZ→internal boundary](#) (critical) — Catastrophic for identity: any credential the actor replayed is a standing re-entry key; the flat DMZ→internal trust converts one FTP foothold into domain compromise. (see analyst finding [F-02](#))
- [Active C2 channel live at the edge of collection \(36s jitter-free beacon\)](#) (critical) — High: an active, capable operator held a live channel out of the network; assume intent to exfiltrate or extort. (see analyst finding [F-03](#))
- [Six persistent backdoor local accounts on dmz-ftp](#) (high) — High: standing re-entry vector that outlives credential resets; must be removed before eradication can be declared complete. (see analyst finding [F-04](#))

- [Scheduled-task / service persistence on the DC \(3 rotations\)](#) (high) — High: durable re-entry independent of the C2 beacon; killing the beacon alone does not evict the actor. (see analyst finding [F-05](#))
- [Credential harvesting in DC memory \(findstr against credential stores\)](#) (high) — High: any secret recovered from the DC is a re-entry key; reinforces the assume-all-credentials-exposed posture. (see analyst finding [F-06](#))
